

# HAMSHACK DASHBOARD - VERSION 2.0

©2023-2024 BY DAVE N2MXX

FOR: WINDOWS APPLE RASPBERRY PI

Hamshack Dashboard is offered as freeware; it may be used and distributed freely without modification and without copyright information removed.

**This document contains 3 sections:**

- **Purpose** (What it does and why)
- **What You Need To Know** (How to download and configure for minimal operation)
- **What Is Nice To Know** (How to fully customize the application)

## Purpose:

This is an HTML file with embedded JavaScript and CSS to display a series of predefined images/animations which facilitates simultaneous monitoring of multiple weather maps, radio propagation, or other data which is available online as an image/animation file URL. A date/time/UTC clock is also provided. All functions can be accessed with only a mouse. Multiple amateur radio resources (band plan, grid squares, etc.) are available instantly by clicking speed buttons on the bottom of the screen.

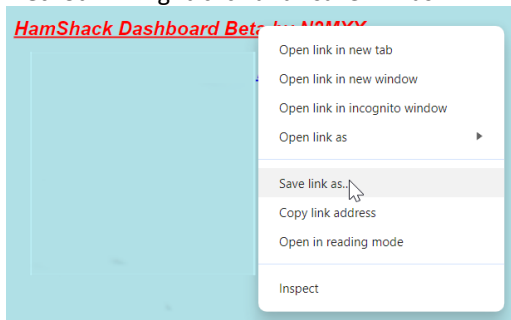

## What You Need To Know:

The HAMSHACK DASHBOARD is located here: <https://nject.us/HAMSHACK-DASHBOARD-O.html>

*Note: This project is hosted on the New Jersey Emergency Communications Team (NJECT) website. The HAMSHACK DASHBOARD is not affiliated with or endorsed by the NJECT; the NJECT does not own nor shall be responsible for the HAMSHACK DASHBOARD.*

## How to save the file to your computer:

**Method #1:** Right-click and "save link as..."

**Method #2:** Open in a browser, right click on any black area (not an image), and select "Save as"...then make sure to save it as a "Webpage, HTML Only"

## How to add your Call Sign, UTC Clock Offset, and Local Doppler RADAR Image (USA):

After you download the file, or even if you use the online version, add the following at the end of the URL:

?callsign=<callsign>&utc=<offset>&state=<state>

<callsign> = Your Amateur Radio Call Sign

<offset> = Your UTC offset in hours

<state> = Your state abbreviation followed by a number (1,2,3,etc) because many states have multiple Doppler radar sites

An example is: ...HAMSHACK-DASHBOARD-O.html?callsign=N2MXX&offset=5&state=NJ1

## How to use the HAMSHACK DASHBOARD:

View the .html file with a web browser such as Chrome, Edge, Safari, or Chromium. It is best viewed in 'full screen' mode. In Chrome:

### Features:

- The display can simultaneously show multiple real-time images/animations on one screen
- A clock with UTC/Local time is updated every second, displayed with users' amateur radio call sign
- Click the refresh icon to the left of the date to reload the page
- The images will automatically refresh every 5 minutes by default; countdown to refresh is shown by the bar in the lower right of the screen (c)2023 N2MXX
- Click on any image to view a large version, then click again to return to the dashboard (or click the refresh/home button)...the image will automatically revert to the dashboard after 20 seconds
- Hover over the grey bar on the bottom for reference and website quick buttons
- - REFERENCE ECARS RADAR POTA CONTEST SWL NETLOGGER
  - The REFERENCE button will display amateur radio reference tools
    - Click on the screen to cycle between tools
    - Click the button to return to the dashboard view
- Hover over the version text v2.0 to show the current available version to ensure that your version is up to date
- The UTC offset and refresh frequency is customized by editing the html text document as described in next section
- All images/links are customized by editing the .html document text as described in next section
- Website quick buttons are customizable by editing the HTML text document as described in next section

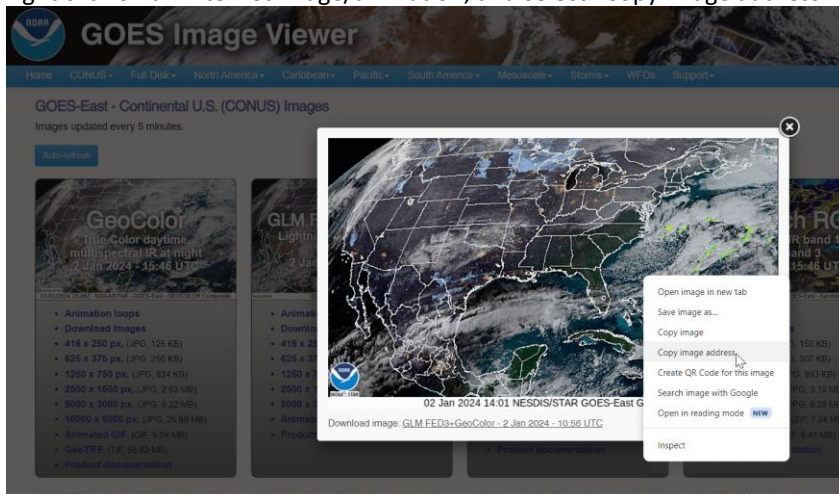

## What Is Nice To Know:

### How to change Image URLs:

An example of an image URL are the NOAA Satellite Images/animations:

<https://www.star.nesdis.noaa.gov/goes/conus.php?sat=G16>

Right click on an internet image/animation, and select "Copy image address":

Open the HAMSHACK DASHBOARD .html file using a text editor (like Windows Notepad):

```
HAMSHACK-DASHBOARD-0.html - Notepad
File Edit Format View Help
//**** IMAGE URLs ****
//**** NOTE: "ImageScale" reduces the display width to reduce distortion for some maps and sun images ****
document.getElementById('ImageA').src="https://services.swpc.noaa.gov/images/animations/d-rap/global/d-rap/latest.png";
document.getElementById('TitleA').textContent="NOAA D-RAP";
window.ImageScale = 1.0;

document.getElementById('ImageB').src="https://radar.weather.gov/ridge/standard/CORUS_loop.gif";
document.getElementById('TitleB').textContent="USA RADAR";
window.ImageScale = 1.0;

document.getElementById('ImageC').src="https://services.swpc.noaa.gov/images/animations/suvi/primary/map/latest.png";
document.getElementById('TitleC').textContent="SOLAR DISC";
window.ImageScale = 0.75;

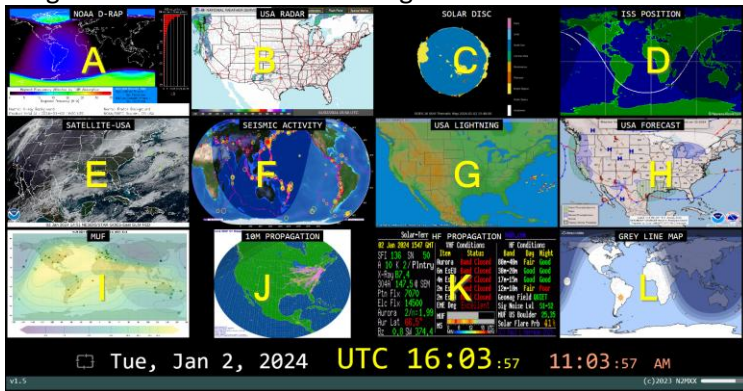

document.getElementById('ImageD').src="https://www.heavens-above.com/orbitdisplay.aspx?icon=iss&width=600&height=300&mode=M&satid=25544";
document.getElementById('TitleD').textContent="ISS POSITION";
window.ImageScale = 1.0;

document.getElementById('ImageE').src="https://cdn.star.nesdis.noaa.gov/GOES16/GLM/CORUS/EXTENT3/GOES16-CORUS-EXTENT3-625X375.gif";
document.getElementById('TitleE').textContent="SATELLITE-USA";
window.ImageScale = 1.0;

document.getElementById('ImageF').src="https://ds.iris.edu/seismon/views/eveday_big/imgs/topMap.eveday_big.gif";
document.getElementById('TitleF').textContent="SEISMIC ACTIVITY";
window.ImageScale = 1.0;

document.getElementById('ImageG').src="https://images.lightningmaps.org/blitzortung/america/index.php?animation-usa";
document.getElementById('TitleG').textContent="USA LIGHTNING";
window.ImageScale = 1.0;
```

Images on the dashboard are assigned A-L:

Decide which image (by letter) you want to replace and paste the URL (which was placed on the clipboard by using “Copy image address”) between the quotes on that image assignment. Then change the text on the next line to whatever text you want to appear at the top of the image for identification. Save the file, and your changes will appear on the dashboard when you reload the page. Image files will work, including animated .gif files; however, movies and entire web pages will not work.

Quick button links and text is defined the same way:

```
//**** UTC OFFSET (HOURS) ****
window.UTCOffsetValue = 5;

//**** BUTTONS ON THE BOTTOM ****
window.ReferenceTitleA = "ECARS";
window.ReferenceURLA = "http://www.ecars7255.com/NCs_Sched/Sched.html";

window.ReferenceTitleB = "RADAR";
window.ReferenceURLB = "https://moe.met.fsu.edu/~mnissenbaum/RadarArchive/KDIX/loop.html";

window.ReferenceTitleC = "POTA";
window.ReferenceURLC = "https://pota.app/#/";

window.ReferenceTitleD = "CONTEST";
window.ReferenceURLD = "https://www.contestcalendar.com/fivewkcal.html";

window.ReferenceTitleE = "SWL";
window.ReferenceURLE = "https://www.short-wave.info/index.php?language=english";

window.ReferenceTitleF = "NETLOGGER";
window.ReferenceURLF = "https://netlogger.org";
```

Some other configurations include:

```
function DefineImageURLs(){
//**** IMAGE URLs REFRESH TIMER (MINUTES) ****
window.RefreshMinutes = 5;

//**** 6 or 12 IMAGES? ****
window.TwelveImages = true;
//If false, then dashboard will display Image A, B, C, E, F, G

//**** ADJUSTS THE HEIGHT OF EACH IMAGE ON THE DASHBOARD ****
window.heightScale = 0.82;
```

**RefreshMinutes** defines the number of minutes between screen refresh. The entire dashboard re-loads together – there are not individual timers for each image.

**TwelveImages** is set to either true or false. When false is selected, only 6 images are displayed (A, B, C, E, F, G). This is useful if you are using a smaller monitor to display the HAMSHACK DASHBOARD.

**heightScale** adjusts the height of all dashboard images....reduce this number (slightly) if the dashboard displays past the bottom of the screen.

Thank you for using the HAMSHACK DASHBOARD!

73,  
Dave N2MXX
